- **Designing:**

We both worked on the designing area together. From button layout to border pane.

At first, we individually designed the GUI and then did check of pros and cons of both of our design and decided to go with this one.

- **FrontEnd/ GUI :**

We have used the agile software development technique. With pair programming idea, one person was the driver and one was observer. We both takes turn for driver and observer.

- **BackEnd/ Logic:**

For Backend logic, we have put together an idea of how to write each code. After that with pair programming we have put down ideas in the programming with pair programming.

- **Testing/Debugging:**

For testing and debugging, we have both take one class each and tested the function of the class individually.

Overall, we have put together a team based effort. We have put each other ideas together and tried to merge it to one new idea. Also, this project also shows so many aspects of the team work where one is disagree and one is not but in the end the merging idea comes out to be the best out of each others ideas.
